

Vmware Selection Procedure

VMware Interview questions for VMWare Technical Support Engineer. VMWare interview was difficult to me. I applied through on line for Technical Support engineer jobs positions. VMware all interviews are in telephonic interview.

In my first Telephonic interview it was VMware Technical Interview.....Most of the questions from windows/ Unix/storage VM ware require strong software development skill in C,C++ with emphasis of multi threaded programming, experience with Windows API programming. In VM ware my interviewer was pleasant and friendly .This section was little bit difficult.

After a week got the second round of interview call.. This was short interview around 25 minutes. Very strong coding skills including diagnostic and troubleshooting skills, virtualization, networking and remote protocols and data base questions were asked.

VM ware interview was not easy.. My advice is that through your knowledge. deep knowledge is needed. Before attending VM Ware interview .refer VMware sites about VMware, products their careers advices, Some of the questions were as follows:

1. What are the different components used in VMWare infrastructure?
2. What is the command used to restart SSH, NTP & VMware Web access?
3. What are the types of Ports groups in ESX/ESXi?
4. What do you mean by a sequential access file?
5. Explain zero based addressing.
6. Explain spaghetti programming.
7. What is the use of Virtual Machine Port Group?
8. How Virtual Machine communicates to another servers in Network ?
9. What is the default number of ports configured with the Virtual Switch?
